

PARADISE THEATERS

RELATIONSHIP

Customer Table

1. customer_number - ticket_number
2. age - film_rating

Ticket Table

3. ticket_number - movie_pass_id
4. movie_choice - movie_menu

Movies Table

(already accounted for)

CONCESSIONS Table

5. transaction_id - rewards_points

paradise_pass_customer Table

(already accounted for)

REASON

1. The customer number can generate multiple ticket numbers since the customer can purchase multiple tickets but these two have a relationship because the customer_number will have ticket_number(s) associated with the customer_number itself.
2. I associated these two because it bases off the rating, whether it's PG or rated X these two rows effect each other because the age of the customer allows them to purchase a ticket to only certain movies or all of them.
3. I paired these two rows because the ticket_number should be different based on the reason that they have a Paradise Pass
4. The pair compliment each other because the movie_choice displayed on the ticket will be a movie chosen from the movie_menu
5. Last of all we have rewards_points! These are generated based off of the transaction_id.
